

One major cause of water pollution in Bangladesh is industrial pollution. Many factories in areas like Savar, Gazipur, Narayanganj, and Chattogram release dirty water, harmful chemicals, and dyes into nearby rivers. They do this because most factories do not have proper waste treatment systems. Due to this weak waste management, the polluted water flows directly into rivers such as the Buriganga, Turag, and Shitalakshya. These toxic chemicals mix with the river water and make it unsafe for drinking, cooking, bathing, and household use.

As a result, people who use this contaminated water suffer from many diseases. They often face skin problems, stomach infections, diarrhea, vomiting, and long-term health issues like kidney and liver damage. Many children get sick frequently because their immune systems are weak. The polluted water also destroys the natural balance of the river. Fish and many aquatic animals cannot survive since the water becomes poisonous and the oxygen level decreases. Consequently, fish populations start to fall sharply.

When fish die or become unsafe to eat, fishermen lose their main source of income. Local markets also suffer because people cannot buy or sell fresh fish. Therefore, many families face financial trouble, and poverty increases in those areas. The pollution also affects tourism and small businesses that depend on clean rivers. Thus, industrial pollution creates serious health problems, harms the environment, and brings economic losses to the country. Hence, it is one of the most dangerous causes of water pollution in Bangladesh.
